

From Requirement to Pull Request — Fully Automated

GitHub Issues → Claude Code CLI → Playwright Tests → PR in minutes

STEP 1

Write Feature Requirement

Product manager fills a structured GitHub Issue with description, acceptance criteria, and scope. No ticket system needed — GitHub Issues is free and native.

GitHub Issues

Issue Form

STEP 2

Add Label to Trigger Pipeline

Apply the `ai-implement` label to the issue. GitHub Actions fires instantly — no webhooks, no external CI setup required.

GitHub Actions

Auto-trigger

The AI Agent Writes Code & Verifies It

Claude Code CLI reads your standards, implements the feature, and runs the full test suite

Tests must pass before commit

STEP 3

Claude Code CLI Implements Feature

AI reads codebase standards from CLAUDE.md, writes production-ready code and Playwright tests — using the same tools a human developer would use.

claude-sonnet-4

Read · Write · Edit

20 turns max

STEP 4

Automated Test Gate

Backend tests and Playwright E2E tests must both pass before any code is committed. If tests fail, artifacts are uploaded and a failure comment is posted on the issue.

Backend tests

Playwright E2E

PR Auto-Created — Human Reviews & Merges

Every AI-generated change goes through mandatory human review before merging to main

✓ AI never auto-merges

STEP 5

Pull Request Auto-Created

Branch is pushed, a PR is opened automatically, the reviewer is assigned via CODEOWNERS, and the original issue is linked and closed on merge.

ai-generated label

CODEOWNERS

STEP 6

Human Reviews & Merges

Engineer reviews the diff, checks the checklist, and approves. Branch protection ensures main is always safe. The AI implements — the human decides.

Code Review

Testing

Safe by design

● Zero infrastructure — runs on GitHub Actions

● ~3 min end-to-end

● Human always approves
